NORTHERN SEA ROUTE | 300 km ONE-WAY UAV COVERAGE

57 candidate launch sites • landing and battery swap on the receiving ship • WGS84 geodesic reach circles

300 km reaches approximately 47% of this reference line (2,186 / 4,675 km).

Average nearest-site distance: 312 km. Complete reference-line coverage needs about 630 km nominal reach.

This is a historical representative route, not a defined corridor or current ice-dependent navigation track. No corridor width is assumed.

All 57 launch candidates are assumed available; electricity, permanent support, access and ship compatibility still require confirmation.

Circles include land and sea. Coverage is geographical only; wind, payload, reserves and the flight after the battery swap are not modeled.

Route source: Arctic Sea Routes feature service, credited to NGA; representative section ~58°E Kara Sea entrance to Bering Strait.

Sources and calculation details: nsr-route-source.txt; nsr-coverage-results.json; nsr-coverage-samples.csv. Coastline: Natural Earth, public domain.

4 November 2026 • Circles calculated on WGS84; display standard parallel 70°N. Route sampled every ≤5 km; radius bound includes 2.5 km sampling allowance.
